

# How do I connect an appliance to a router?

First you need to connect the WiFi module to your device

After that, you need to go to [device configuration menu](#), and go to the **Network/WiFi** tab and select Client mode

You will then need to click **Scan WiFi** to view the existing WiFi networks. After viewing **SSID**, **security type** of AP and its **MAC address**, in the Client management menu you can set the priority of connection to APs and enter their **SSID** and **password**, also if you wish you can perform a **connection test** to determine signal quality
